**How would the vertical expansion be designed?**

**STAGE I BERMS**

1. Berms constructed from clean Calumet Harbor sediment and a waterproof liner. Vegetation planted for erosion control.

**STAGE II BERMS**

2. Sediment not suitable for beneficial use would be confined.

3. A second level of berms would increase the facility's capacity if/when needed.

**CAPPED AND CLOSED**

4. Once full, the facility would be capped, closed, and turned over to the non-federal sponsor.
